

Markov chains

Zombini's

at time step 0: fraction of Zombini's

at island A is a

at island B is b

note: $a, b \geq 0$

at $b = 1$

at time step 1:
$$\begin{pmatrix} \frac{1}{2}a + \frac{3}{10}b \\ \frac{1}{2}a + \frac{7}{10}b \end{pmatrix} = \begin{pmatrix} \frac{1}{2} & \frac{3}{10} \\ \frac{1}{2} & \frac{7}{10} \end{pmatrix} \begin{pmatrix} a \\ b \end{pmatrix}$$

at time step 2:

$$A \left(A \begin{pmatrix} a \\ b \end{pmatrix} \right) = A^2 \begin{pmatrix} a \\ b \end{pmatrix}$$

⋮

at time step n : $A^n \begin{pmatrix} a \\ b \end{pmatrix}$

Question: what happens long term?

ie. what can we say about $\lim_{n \rightarrow \infty} A^n \begin{pmatrix} a \\ b \end{pmatrix}$?

Definition: A stochastic matrix is an $n \times n$ matrix over \mathbb{R} such that

(a) every entry of $A \geq 0$

(b) the sum of all entries in each column is one.

$$\sum_{i=1}^n A_{ij} = 1 \quad \forall j=1, \dots, n$$

Definition: A vector $\vec{p} = \begin{pmatrix} p_1 \\ \vdots \\ p_n \end{pmatrix}$ is called a probability vector if

(a) $p_i \geq 0 \quad \forall i$

(b) $p_1 + \dots + p_n = 1$

Remark: if $A_{ij} \geq 0 \quad \forall i, j$ and $\vec{u} = (1 \ 1 \ \dots \ 1) \ (1 \times n)$ then A is a stochastic matrix $\Leftrightarrow \vec{u} A = \vec{u}$

Corollary: if A, B are both stochastic matrices, then so is AB

proof. $AB_{ij} \geq 0 \quad \forall i, j$ easy to see

$$\vec{u}(AB) = (\vec{u}A)B = \vec{u}B = \vec{u} \Rightarrow AB \text{ a stochastic matrix}$$

Markov Chain

Have n states

get matrix A $n \times n$, stochastic.
Interested in long term behavior.

Definition: Suppose $A_{n \times n}$ is a stochastic matrix.

A is called regular if there is some power of A with all entries positive.

We will assume A is diagonalizable

Goals: ① Show $\lim_{m \rightarrow \infty} A^m = L$ exists

② Each column of L is identical

③ If $\vec{p} = \text{ANY}$ probability vector, then
 $\lim_{m \rightarrow \infty} A^m \vec{p}$ exists and equals \vec{v} .

Aside on limits: given a matrix A , consider $(A^m)_{ij}$,
 $\lim_{m \rightarrow \infty} (A^m)_{ij} = L_{ij}$ MIGHT exist or MIGHT not.

If all exist, write $\lim_{m \rightarrow \infty} A^m = L$

Some basic facts (prove on your own):

① If B is a matrix, then $\lim_{m \rightarrow \infty} BA^m = BL$

② $\lim_{m \rightarrow \infty} A^m C = LC$, C a matrix OR vector

example: $A = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$

When does $\lim_{m \rightarrow \infty} A^m$ exist?

Idea: if

$$A = Q \begin{pmatrix} \lambda_1 & 0 & \dots & 0 \\ 0 & \ddots & & \\ 0 & & \ddots & \\ 0 & \dots & 0 & \lambda_m \end{pmatrix} Q^{-1}$$

then

$$A^m = Q \begin{pmatrix} \lambda_1^m & & & \\ & \ddots & & \\ & & \ddots & \\ & & & \lambda_m^m \end{pmatrix} Q^{-1}$$

this limit exists $\Leftrightarrow \lim_{m \rightarrow \infty} \lambda_i^m$ exists

In our 2×2 matrix, have $\lambda_1 = 0.2$, $\lambda_2 = 1$. So limit exists.

Thus

$$\lim_{m \rightarrow \infty} A^m = \begin{bmatrix} 0.375 & 0.375 \\ 0.625 & 0.625 \end{bmatrix}$$

Assume: A is an $n \times n$ matrix, over \mathbb{C} . Want to understand where eigenvalues lie.

Definition: Let $p_i(A) = \sum_{j=1}^n |A_{ij}|$ Sum of absolute values in row i

Let $v_j(A) = \sum_{i=1}^n |A_{ij}|$ Sum of absolute values in col j

$$p(A) = \max(p_1(A), \dots, p_n(A))$$

$$v(A) = \max(v_1(A), \dots, v_n(A))$$

example

$$A = \begin{pmatrix} 2 & -i & 1 \\ 3+4i & 0 & -3 \\ 1 & 2 & i \end{pmatrix} \quad \begin{array}{l} v = 8 \\ p = 8 \end{array}$$

Definition: Given A , the i^{th} Gershgorin disk is

$$C_i = \{z \in \mathbb{C} : |z - A_{ii}| \leq r_i\} \quad \text{Roc}$$

where $r_i = p_i(A) - |A_{ii}|$

example (back to Zombini)

$$A = \begin{pmatrix} 0.5 & 0.3 \\ 0.5 & 0.7 \end{pmatrix}$$

$$C_1 = \{z \in \mathbb{C} \mid |z - 0.5| \leq 0.3\}$$

$$C_2 = \{z \in \mathbb{C} \mid |z - 0.7| \leq 0.5\}$$

Theorem: Let $A \in \mathbb{C}^{n \times n}$, and C_1, \dots, C_n be Gerschgorin disks.

Then if λ is an eigenvalue of A , then $\lambda \in C_i$ for some i .
